Teacher Supply and Demand

This report presents figures portraying the status of school finance for the 1968-69 school year, and outlines the trends that will have some impact on school finance in the near future. Among the areas discussed are population and enrollment trends, staffing of schools, expenditures on education, and revenue for educational purposes. The study's highlights included: (1) Births and birth rates declined, but total enrollment rose: (2) shortages of qualified teachers continued, but the percentage of teachers without a bachelor's degree declined: (3) teacher strikes and sanctions continued to grow: (4) central cities continued to lose resources while their expenditures increased: (5) Stato tax revenue increased more in 1968 than in any previous year primarily as a result of mounting property taxes. The outlook for 1970 is good, under pending State legislation on taxes and school funding, although it is partly clouded by inflation. Similar data for 1967-68 can be found in EA 002 481. (DE)

FOREWORD

This report presents the status of school finance and trends affecting school finance. A few highlights are worth special mention.

Births and birth rates are declining. As a result, the class entering elementary school will decline yearly through 1974. However, total enrollments are rising. More members of the age group 5-24 years are attending school, and enrolling sooner and staying longer. Kindergartens, junior colleges, and state colleges and universities are expanding fast.

Shortages of qualified teachers and other professional workers continue, but the percentage of teachers without a bachelor's degree is declining.

Increasing irritation with the slow rate of progress in increasing salaries, supportive staff, and classroom supplies and equipment is shown by the growing number of teacher strikes and sanctions. Teacher/school-board negotiation agreements also are increasing.

The central cities are spending less for schools than the nearby suburbs and losing resources while their expenditures continue to increase. However, neither the increased burden for education nor the decreased base for school support is recognized by state grant plans for local schools.

State tax revenue increased more in 1968 than in any previous year, with new enactments or higher rates. Mounting property taxes for schools provided the major increase in school funds as the state tax enactments were not for school revenue alone and as federal grants declined. Nonetheless, schools were better financed in 1968-69 than in previous years, and the outlook for next year is good, under pending state legislation on taxes and school funding, although partly clouded by inflation. The improvement in school finance is largely the result of the public's confidence in education as an investment and of the profession's work for increased school support.

The NEA Committee on Educational Finance presents this sixth annual report so that the teaching profession may assess the progress in financing schools and prepare for the tasks ahead. This report is the work of the Research Division staff: Eugene P. McLoone, Assistant Director and NEA Staff Contact for the Committee on Educational Finance; Joanne H. Bodley, Research Assistant; Ellen Roderick, Staff Assistant; and Beatrice C. Lee, Publications Editor.

William D. Firman, Chairman

DIMENSIONS OF FORMAL EDUCATION

IN FALL 1968, 58.3 million pupils were enrolled in the regular schools, public and private, at all grade levels. All full-and part-time workers in the schools were estimated at 5.8 million, 3.7 million of which were teachers, administrators, or other professional staff. The total expenditures of the regular schools are estimated at \$59.5 billion for the school year 1968-69.

Pupils

Enrollment in the regular schools totaled 46.0 million in 1960. By fall 1968 enrollment increased 12.3 million, or 26.7 percent, to 58.3 million. Total enrollment is expected to rise by 3.4 million, or 5.8 percent, to 61.7 million by fall 1975.

In the past eight years the largest percentage gains in enrollment have been in higher education and in the public sector as follows:

Fall enrollment (in millions)

Increases and projections	Level	<u>1960</u>	1968	Projections,	Percent 1960 to 1968	1968 to 1975
	Public elementary and secondary	36.3	44.7	45.8	23.1%	2.5%
•	Private elementary and secondary	5.9	6.0	5.9	1.7	-1.7
	Public higher education	2.3	5.5	7.4	139.1	34.5
	Private higher education	1.5	2.1	2.6	40.0	23.8
	ТОТАТ.	46.0	58.3	61.7	26.7%	5.8%

Part A-Summary Data, 1968. Washington, D.C.: Government

Printing Office, 1968. Table 1, p. 5.

Greatest gains in colleges

The largest percentage gains in enrollment since 1960 have been in institutions of higher education. Enrollments in the public institutions of higher education have more than doubled, increasing nearly 140 percent from fall 1960 to fall 1968. The largest increase in numbers enrolled has been in the public elementary and secondary school where enrollments climbed 8.4 million from 36.3 million in fall 1960 to 44.7 million by fall 1968.

The enrollment increase expected between fall 1968 and fall 1975 is more moderate. Enrollments in public higher education are expected to continue to increase considerably faster than other school sectors for a seven-year gain of 34.5 percent. The public elementary— and secondary—school enrollments are expected to increase 2.5 percent by fall 1975 and to add an estimated 1.1 million pupils over the seven-year period, with most of the increase coming in the next two years to 1970.

The enrollments cited above are mainly those in the regular school programs leading to diplomas or degrees. Hence, the figures understate the involvement of the total population in education and work-related training and retraining. include nursery school and some Head Start programs, adult education programs, post-high-school sub-collegiate vocational training, Job Corps training, apprentice programs, and inservice training programs for employees. Other types of enrollment not included are those in residential schools for exceptional children, elementary and secondary schools associated with institutions of higher education, and some federally operated schools on reservations and installations. Enrollments in special schools, such as trade schools and business colleges, which are not reported as enrollments in regular schools, totaled 1.4 million according to the fall 1967 enrollment survey of the Bureau of the Census.-

Enrollments in special schools

The size of enrollment that ahead reflects expected changes in the numbers in the school-age population, the school retention rates for the teen- and college-age youth, the increase in kindergarten attendance for 4- and 5-year-olds, and changes in the shares of enrollment between public and private schools.

Population

The total population of the United States, including the armed forces overseas, increased 28.3 million from 151,718,000 in April 1950 to 180,007,000 by April 1960. Growth slowed

^{1/} U.S. Department of Commerce, Bureau of the Census. School Enrollment: October 1967. Current Population Reports. (in press)

down during the 1960's. By July 1968 the total population was estimated at 201,166,000 and is expected to reach between 215,367,000 (Series D) and 223,785,000 (Series B) in 1975 for a total gain of 14.2 million to 22.6 million persons in seven years.

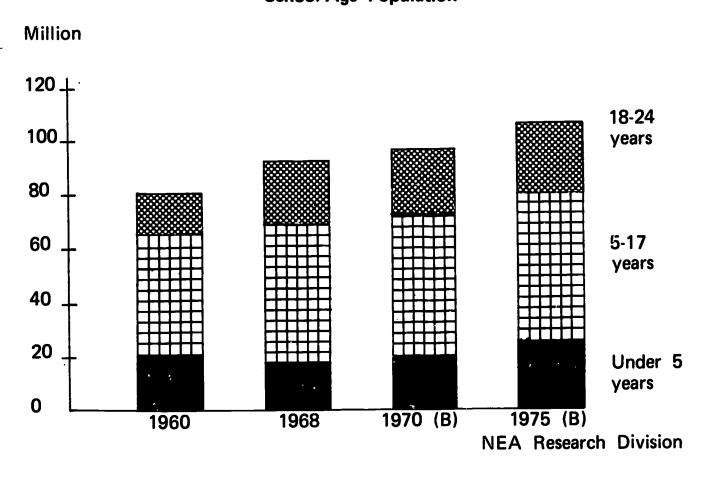

Changes in school-age group

The school-age population (5 to 17 years of age) increased 18.3 percent from 44,196,000 in July 1960 to 52,292,000 in July 1968 and is expected to increase 1.4 percent by July 1970. By 1975 the population 5-17 is expected to remain at about the 1970 level in the B series of Census projections, near the 1968 level in the C series of Census projections, or decline to about the 1966 level in the D series.

The population of college age, which increased 41.7 percent from 16,122,000 in July 1960 to 22,842,000 in July 1968, is projected to increase 17.6 percent to 24,589,000 by 1970 and on up to 27,536,000 by 1975.

The population under 5 years of age--the preschool age group--declined from 20,364,000 in July 1960 to 18,521,000 in July 1968. The Census projections of this age group for 1970 range from 20,027,000 (Series B) to 17,625,000 (Series D) and

a/ Totals differ slightly from summary of state detail given in Table 1.

for 1975 from 24,350,000 (Series B) to 18,323,000 (Series D). A summary of the population by age groups is shown above.

Table 1 shows by state the resident population (not including armed forces overseas) for 1960, 1968, and four projections for 1975. Series I and II represent two assumptions about the migration rate of the population among the states. Series B and D are based on different assumptions about the fertility rate. Series B assumes a moderate increase from present fertility levels; whereas, Series D assumes a continued decline from present levels.

Continued decrease in birth rate

Table 2 shows the estimates of births for the years ending June 30 since World War II and the two series of projections of births to 1975. In 1965, the number of births fell below the 4 million mark for the first time since 1953. In the past three years there has been a further decrease in births. The birth rate itself also experienced a drop--to 17.4 in 1968--the lowest in this century.

U.S. Department of Commerce Bureau of the Consus Population Reports of Commerce Population Reports

U.S. Department of Commerce, Bureau of the Census. Revised Projections of the Population of States 1970 to 1985.

Current Population Reports, Series P-25, No. 375. Washington, D.C.: Government Printing Office, October 3, 1967.
p. 18, 19.

NOTE: Series I is based on the assumption that the gross interstate migration patterns will continue throughout the projection period within the range observed in 1955-1960 and 1960-1965.

Series II is based on the assumption that the state migration differentials will gradually be reduced so as to result in no net migration in 50 years.

Series B and D are based on different assumptions of national fertility. Series B assumes a moderate increase from present fertility levels. Series D, however, assumes a continued decline from present levels. Assumptions of mortality and immigration in the two series are the same.

Because of rounding, detail may not add to totals.

Stable Migration

U.S. Bureau of the Census studies of migration since 1948 show that the annual variation in the rate has been small, ranging between 18.3 and 21.0 percent. From March 1966 to March 1967, 18.3 percent of the total population moved. The migration rates shown below indicate low levels of migration for all but the youngest segment of the elementary— and secondary—school age groups and a rather high rate for the college and young adult group:

MIGRATION RATES

			<u>Differ</u>	ent county

U.S. Department of Commerce, Bureau of the Census. Mobility of the Population of the United States, March 1966 to March 1967. Current Population Reports, Series P-20, No. 171. Washington, D.C.: Government Printing Office, April 30, 1968. p. 12.

Changes in net migration

In recent years the West continued to gain from net migration, but the gains declined sharply from an annual average of 500,000 from 1960 to 1964 to an average of 150,000 from 1964 to 1966. From 1965 to 1966, a gain of 60,000 in net migration was registered for the Northeast compared to losses noted in prior years.

As in previous years, 1967 Census figures again indicated a greater incidence of mobility in the population in the West than in any other region. The total mobility rate for the West was 24 percent, as compared with 21 percent for the South, 17 percent for the North Central region, and 14 percent for the Northeast.

Projections of metropolitan area population for 1965 to 1975 show that the metropolitan areas of the West are growing at a faster rate than any other region. By 1975, the West will gain 5.4 million persons, with 2.9 million attributable to net in-migration, so that the metropolitan area population will increase 23.6 percent.

METROPOLITAN AND NONMETROPOLITAN POPULATION AVERAGE ANNUAL CHANGE, 1960-1966 AND 1966-1968

Source:

U.S. Department of Commerce, Bureau of the Census. <u>Trends in Social and Economic Conditions in Metropolitan Areas</u>. Current Population Reports, Special Studies, Series P-23, No. 27. Washington, D.C.: Government Printing Office, February 7, 1969. p. 3.

The metropolitan areas of the South are projected to increase 16.2 percent, or 4.6 million, by 1975; of this number, 1.5 million will result from net in-migration. For the North Central region, a 7.9 percent increase in population, or 2.5 million, is projected for the 10 years from 1965 to 1975. This increase is attributable to natural causes since a loss of 317,000 in population is projected from net out-migration. Net in-migration will account for 265,000 of the projected increase of 2.4 million, or a 6.4 percent increase in the metropolitan areas of the Northeast.

People are moving to metropolitan areas and to suburban counties within metropolitan areas. On July 1, 1965, 130 million persons, or about two-thirds of the population of 194 million, were living in 219 metropolitan areas, which comprise 437, or one-seventh, of the 3,049 counties. Migration to metropolitan areas continued from 1960 to 1965 but at a slower rate than in the decade from 1950 to 1960.

Suburban counties gained at a higher rate from migration than did central counties. Because of the age of migrants, suburban counties registered larger natural increases in population (births minus deaths) than did other areas.

a/ Calculated by NEA Research Division from: U.S. Department of Commerce, Bureau of the Census. Estimates of the Population of the United States to October 1, 1968. Current Population Reports, Population Estimates, Series P-25, No. 410. Washington, D.C.: Government Printing Office, November 19, 1968. p. 2.

From 1960 to 1965, central counties also had a higher rate of natural increase in their population than nonmetropolitan counties. These facts of migration point to increasing numbers of school-age children in metropolitan counties, and an increasing percentage of total school-age population in these counties. Most probably, the increase will be greater in the more heavily populated metropolitan areas as the rate of migration increases from smaller to larger metropolitan areas.

A discernible relationship exists between income level and mobility rate. Census figures show that the mobility rate for men with annual incomes below \$7,000 was appreciably higher than that among men whose incomes exceeded \$7,000. Men in the income brackets below \$7,000 had a mobility rate ranging from 18.3 to 22.7; those with incomes of \$7,000-9,999 had a 15.4 mobility rate, and those in the over \$10,000 range had the lowest rate, 13.0.

Propensity To Attend School

In October 1967, more than 99 percent of the school-age population age 7 to 15 years were enrolled in public or private regular schools. Table 3 shows the 10-year trend in the enrollment ratios of the civilian noninstitutional population. Over the years from fall 1957 to fall 1967, enrollment of 5-year-olds in kindergarten and elementary school increased from 60.2 percent to 75.0 percent. The ratio for 6-year-olds, which was 97.4 percent in 1967, improved to 98.4 percent by 1967. The ratio for 16- and 17-year-olds increased 8.3 percentage points from 80.5 percent in 1957 to 88.8 percent in 1967. Sharp increases are also noted for the older groups, 18-19 and 20-24 years.

Youth not enrolled in school

The number of youth 5-17 years old not enrolled in school has decreased in recent years despite an increase in the population of the age group. In 1960, 2,752,000 youth 5-17 in a population of 45,053,000 were not enrolled in school. By 1965, 2,426,000 youth in a population of 49,904,000 were not enrolled. In October 1967, an estimated 2,188,000 youth in the 5-17 population of 51,464,000 were not enrolled. Of the number not in school, 1,061,000 were 5- and 6-year-olds, 208,000 were 7 to 13 years old, and 919,000 were 14 to 17 years old.

If the enrollment population ratio for the youngest and oldest segments of the school-age group had been at 99.3 percent in fall 1967, school enrollment would have been larger by an estimated 1.8 million pupils--1.0 million more 5- and 6-year-olds in kindergarten and elementary school and nearly 820,000 additional 14- to 17-year-olds.

0

School dropouts

There is an accumulation of young adults in the population who have left school prior to high-school graduation. The Bureau of the Census has estimated that 4,716,000, or 13.6 percent of young adults 14 to 24 years of age, almost 750,000 of whom were still under 17 years of age, were not high-school graduates and were not enrolled in school in 1967. Many of these young adults could return to school to complete high school.

College Enrollment

College enrollments, comprising degree and nondegree students, resident and extension, exceeded 7.5 million in fall 1968. Annual percents of increase of college enrollments are larger than those of the high-school graduates. College enrollments have followed the upward trend in number of high-school graduates which reflects a higher high-school rentention rate. All of these increases are in addition to the growth in the population of high-school and college age. The figures below show the trend since 1960 in number of college students and the percent of change over the previous year in both college enrollments and high-school graduates.

Trend in college enrollment

		Percent increase over previous year

Private Schools

Until the late 1960's, enrollments in private elementary and secondary schools increased proportionately faster than enrollments in the public schools (Table 5). The private-school share of total enrollments rose from 10.9 percent in fall 1950 to 14.9 percent by fall 1959. Since 1959, the percentage has decreased to an estimated 12.0. Between fall 1966 and fall 1967, private elementary-school enrollment (grades 1-8) decreased from 4,684,000 to 4,562,000, and private high-school enrollment (grades 9-12) decreased from 1,377,000 to

129, 148, 161, 162, 167, and 179.

1,292,000. According to the Bureau of the Census figures (grades 1-12), there were 207,000 fewer enrollees in fall 1967 than in fall 1966.

Enrollment in private colleges and universities continued to grow, but at a rate lower than that of the public institutions. The figures below show the trend in the percents that enrollments (for degree credit only) in private institutions are of total enrollments in all institutions of higher education.

	Percentage of total enrollment
Fall 1960	40.1%
Fall 1965	33.0
Fall 1968	29.4
Fall 1975 (projected)	26.0

Sources:

Outlook

By fall 1975, the total enrollment at all levels of the regular schools is projected to 61.7 million, a gain of 3.4 million from 58.3 million in fall 1968.

Projections

Almost three-fourths of the increase to 1975, 2.4 million, is expected in the enrollments of institutions of higher education over the seven years ahead, compared with an increase of 3.8 million in the eight years from 1960 to 1968. The projections of enrollments at the collegiate level are based on trends of the enrollment-population ratio. However, 36.6 percent of the population 18-21 years of age was enrolled in college in 1966, up from 27.6 percent in 1960. According to projections based on Bureau of the Census figures, this ratio will increase only moderately to 37.8 percent by 1970 and to

U.S. Department of Health, Education, and Welfare, Office of Education. Projections of Educational Statistics to 1977-78. 1968 edition. Washington, D.C.: Government Printing Office, 1969. p. 9.

Part A-Summary Data, 1968. Washington, D.C.: Government
Printing Office, 1968. p. 8, 20.

41.4 percent by 1975.2/ The population of college age can be predicted with a high degree of accuracy. However, the strength of the increase in the proportion of the population that will attend college is less certain.

The elementary- and secondary-school enrollments are projected to increase 1.0 million from 50.7 million in fall 1968 to 51.7 million in fall 1975. All of the increase is projected for the public schools. However, if the private-school enrollment continues to decline at the rate since 1960, the increase in enrollment of the public schools could be greater.

The enrollment-population ratios used in the Census projections indicate moderate improvement by 1975; nearly 950,000 5- and 6-year-olds and 800,000 youth 14 to 17 years old would not be enrolled. If near-maximum enrollment of all segments of the population 5 to 17 years old were achieved by 1975, elementary- and secondary-school enrollments would increase by about 2.6 million.

EMPLOYMENT IN THE SCHOOLS

ALL FULL- AND PART-TIME WORKERS in the regular schools at all levels of education totaled an estimated 5,800,000 in fall 1968, up 5.5 percent from last year's total of 5,500,000. On a full-time equivalent basis, education provided an estimated 4,800,000 jobs. Workers employed in the regular schools are 8.4 percent of the employed civilian labor force. These estimates do not account for many workers in the special community programs financed with federal funds from the U. S. Office of Economic Opportunity, foundations, and other sources.

The total number of full- and part-time professional workers employed in the regular schools is estimated at 3,729,000, 75.0 percent of whom are in elementary and secondary schools and 25.0 percent in higher education.

Elementary- and Secondary-School Teachers

For the school year 1968-69 the instructional staff--class-room teachers, principals, supervisors, and others--is estimated at 2,131,625 on a full-time equivalent basis for public schools and 242,000 for private schools. While the figure for public schools is based on an annual survey of the NEA Research Division, $\frac{1}{2}$ the private-school staff is estimated by the U. S. Office of Education partially from benchmark surveys of previous years. $\frac{2}{2}$

Pupil/teacher ratio

The number of pupils enrolled per instructional staff member in the public schools decreased from 24.7 in 1957-58 to 21.2 in 1967-68 and 21.0 in 1968-69. The pupil-teacher ratio changed as follows: At the elementary level the ratio decreased from 29.4 in 1957-58 to 26.2 in 1967-68 and to 26.1 in 1968-69; at the secondary level the ratio, which was 22.0 in 1957-58 was 20.1 in 1967-68 and 19.9 in 1968-69.

A comparable trend in the estimated staff ratios in private schools is reported by the U. S. Office of Education: At the elementary level the estimated ratio dropped from 37.5 in 1957-58 to 29.3 in 1968-69; at the secondary level the ratio decreased from 17.3 to 15.6.

Profile of the Public-School Teacher

In the spring of 1968 the average public-school teacher was 39 years of age; had taught for 12 years, 8 of which were in the same school system; and reported an average salary of \$7,423 for the school year. The elementary-school teacher taught an average of 28 pupils. The secondary-school teacher taught an average of 5 class periods of 26.0 pupils each. All but 4.7 percent of the classroom teachers had at least a bachelor's degree. Table 6 gives the profile figures by sex and level of school.

Supply of Teachers

The chronic problem of staffing public schools with qualified teachers was again acute in the school year 1968-69.

Special surveys

ERIC

Two special surveys were conducted in mid-summer 1968 to obtain current information about the general status of supply-demand conditions in the states and major cities, the subject areas in which shortages seemed most widespread, and the conditions in fall 1968 as compared to those one year earlier. In the first of the surveys, state department of education officials were asked to report their general impression of teacher supply and demand conditions in their states. In the second survey, personnel directors in the nation's 79 largest school systems (those enrolling 50,000 or more pupils and employing one-fifth of all public-school teachers) were asked to report unfilled positions, employed substandard teachers, and difficulty in filling teacher positions. 3/

State department of education officials in 42 states reported the general condition of public-school teacher supply and demand in summer 1968. Their assessment of how the total number of qualified teacher applicants compared with the number of teaching position vacancies in August 1968 was as follows:

- 5 states—substantial shortage of applicants
- 7 states—some shortage of applicants
- 9 states—shortage of applicants in some subject areas and an excess in others
- 1 state--sufficient applicants to fill positions.

None of the states reported having some excess of applicants or having substantial excess of applicants. The remaining eight states did not have sufficient information to allow a valid appraisal.

Source:

National Education Association, Research Division. Annual Survey of Teachers, 1967-68.

a/ Based on sample and subject to sampling variability.

The situation regarding qualified teacher applicants in August 1968 compared with August 1967 was reported by 8 states as being more acute, by 25 states as being about the same, and by eight states as being less acute. None of the states reported the condition to be much more acute or much less acute than one year ago. Nine states did not have sufficient information to report.

Factors of Unusual Influence

In response to an inquiry about conditions having unusual influence toward decreasing the supply of teachers this year, 19 states indicated that the supply of teachers was not smaller than last year. Among the remaining 22 states that responded, the conditions having increased influence toward a smaller number of qualified applicants in 1968 than in 1967 included:

- 11 states--federal programs
- 11 states—greater opportunities in business and industry
- 9 states--location of vacancies not attractive
- 10 states--salaries and benefits not attractive
- 11 states--military service.

Other reasons

ERIC

Other reasons cited for smaller numbers of qualified applicants included: fewer persons completing preparation, two states; and fewer persons applying for re-entry into teaching, one state.

The states were asked to identify the factors having increased influence if the demand for new teachers is greater than last year. Among the 23 states reporting increased demand the reasons given include:

- 12 states—new positions resulting from federal legislation
- 18 states--increased school enrollment
- 11 states—-added curricular offerings
- 2 states—larger number of teachers not returning to their positions
- 8 states--reduction of average class size.

Twenty of the 43 states responding to this question indicated that the demand for new teachers is not greater than was observed last year.

Shortages

According to state department of education personnel, the acute shortages for teaching assignments in the lower grades were more widespread than were acute shortages at the higher levels. The levels of instruction and the numbers of states reporting that supply-demand conditions were more acute this year than last year include: lower elementary-school classes, 12 states; upper elementary-school classes, 6 states; senior high school, 6 states; and supporting staff (psychologists, remedial teachers, etc.), 16 states.

Many school systems were encountering extreme difficulty in filling teaching positions for 1968-69 in the following subject areas (most frequently listed by 44 states reporting this information): special education, 30 states; mathematics, 20 states; special assignments in remedial reading, speech correction, etc., 18 states; special assignments directed to educationally disadvantaged children, 16 states; natural and physical sciences, 12 states; industrial arts, 24 states; physical and health education (women), 19 states; trade-industrial-vocational-technical, 10 states; elementary-school

classes, 7 states. The most frequently listed assignment areas in which states expect school systems generally will have to employ persons with substandard qualifications are elementary, 20 states; mathematics, 16 states; natural and physical sciences, 14 states; industrial arts. 14 states; special assignments directed to educationally disadvantaged children, 15 states; special education, 24 states; physical and health education (women), 10 states; speech correction, etc., 15 states; guidance personnel, 14 states; trade-industrial-vocational-technical classes, 11 states; and English language arts, 10 states.

The second survey queried personnel officers in the 79 largest school systems about teacher supply and demand conditions in their systems as of the first week in August. Seventy-six systems reported 2,665 unfilled positions for elementary school; these vacancies represented 1.4 percent of the elementary-school teachers in these systems. The 2,817 unfilled positions in secondary schools represented 1.8 percent of the total secondary-school teachers in these systems in fall 1968.

Fields of shortage

The assignment areas identified in the 21st national annual study as having an inadequate supply of teachers were also reported as being in short supply by significant numbers of the large school systems:

	Number of large school systems reporting EX- TREME DIFFI- CULTY in fill- ing positions	Number of posi- tions not filled in August in the large school systems

Source:

National Education Association, Research Division. Teacher Supply and Demand in Public Schools, 1968. Research Report 1969-R4. Washington, D.C.: the Association, 1969. p. 48-55.

a/ Evaluation of general condition based on estimated shortages between supply and demand of beginning teachers and possible reduction of 10 percent in teacher re-entry rate.

b/ Information is not sufficiently complete to allow an accurate estimate of supply-demand conditions.

Supporting these reports of shortage were the relatively large numbers of these large school systems which reported that they had to employ persons with substandard qualifications in these assignment areas: 21, industrial arts; 15, mathematics; 27, special education; 17, elementary-school regular instruction; 7, natural and physical sciences; 11, the trade-vocational-technical subjects; and 6, women's physical and health education.

Differences among the states in the indentification of librarians and guidance counselors separately from other instructional personnel reduce the accuracy of national estimates of the demand for persons for these positions. The reports from the states and the large school systems suggest that the new supply of applicants for these positions is not adequate for current needs. Twenty-three of the 44 states reporting supply-demand conditions for elementary-school librarians reported that school systems were having extreme difficulty in filling these positions, and 16 reported that they expected school systems generally would have to employ persons with substandard qualifications.

Reports from the states and the large school systems showed that many also had a limited supply of teachers having qualifications for special instructional assignments, such as working with educationally disadvantaged pupils, and were encountering extreme difficulty in filling these positions.

Respondents in 42 states were able to report conditions by population areas in their state. All states except one reported having a shortage of applicants in rural areas, 33 in small cities of large urban centers, 18 in central cities of large urban centers, and 14 in suburban areas.

The numbers of states reporting conditions in these population areas as more acute than last year were as follows:

- 4 states--in rural areas
- 11 states--in small cities
- 17 states—in central cities of large urban centers
- 5 states--in suburban areas.

The special surveys showed that considerable numbers of school systems experienced shortages in the assignment areas which had been projected to be in low supply nationally.

Table 7 (on page 25) summarizes numerically differences between the supply of beginning teachers and the estimated demand for beginning teachers. The two columns showing the range of difference in the shortage or excess in supply of beginning teachers and demand should be interpreted as an estimated range of the supply-demand condition rather than a precise measure.

Unpublished data from Nationwide Teacher Opinion Survey, 1966-67, 1967-68.

a/ Based on sample surveys and subject to sampling variability.

The shortage of elementary-school teachers is termed "low supply" based on the estimated small margin of supply of beginning teachers and the impact on this supply resulting from a possible reduction of 10 percent in teacher re-entry rate. At the secondary level the supply by subject field ranged from a shortage of teachers of mathematics, the natural and physical sciences, and the technical and vocational offerings, to an adequate supply of teachers of art, music, foreign languages, social studies, and men's physical education.

College Training of Teachers

Steady progress is noted in reducing the proportion of all classroom teachers without bachelor's degrees (Table 8, page 27). By 1966, less than 1 percent of the secondary-school teachers lacked bachelor's degrees although the percent increased to 1.5 in 1967. In 1968, the percentage dropped to 1.4 percent. At the elementary level, the proportion dropped from 34.1 percent in 1956 to 7.9 percent in 1968. Also at the elementary level, a continued increase is noted in the proportion of teachers with master's degrees. Despite a strong consensus that a master's degree should be a requirement for teaching at the secondary level, the proportion of secondary-school teachers with advanced degrees dropped from 43.7 percent in 1956 to 37.2 percent in 1967.

Salaries in Public Schools

Salaries are higher

The average salary paid the instructional staff gained \$485, or 6.3 percent, from \$7,709 in 1967-68 to \$8,194 in 1968-69. Table 9 (on page 29) shows the 11-year trend in instructional staff salaries by state.

Regional differences in teachers' salaries are acute. The dollar difference between the average salaries of classroom teachers in the Southeast at \$6,802 and in the Far West at \$9,165 was \$2,363. In 1963-64, the dollar difference was \$2,167. When the salaries for 1963-64 and 1968-69 are compared in Table 10, some improvement is noted in the salaries of the Southeast relative to the U. S. average whereas the relative position of the Mideast, Rocky Mountain, and the Southwest regions have worsened.

City worker's family budget

The annual cost of living at a moderate standard for a specified family of four persons averaged \$9,076 in spring of 1967 in urban areas of the United States. The cost averaged \$9,243 in large metropolitan areas and \$8,366 in smaller cities (2,500 to 50,000 population). The average salary paid classroom teachers in 1966-67 was \$6,830.

Mean Scheduled Salaries for Teachers, 1968-69 (School systems enrolling 6,000 or more)

NEA Research Division

The new budget, recently released by the U. S. Department of Labor, Bureau of Labor Statistics, is based on standards of the 1960's. For each of the areas shown, the average salary of teachers in 1966-67 was lower than the cost of the city worker's budget—the index relationships range from 69.6 for Durham, N.C., to 99.1 for the San Francisco—Oakland area.

It should be emphasized that the newly revised city worker's budget for a moderate standard of living in the spring of 1967 was based on a specific family and must be adjusted for other types and sizes of family. The four-member family considered in the development of the budget costs consists of a husband age 35-54, wife (not employed outside the home), and two children, 6 and 15. The Bureau of Labor Statistics has

issued a revised equivalency scale for application of the budget to families of varying sizes (BLS Bulletin 1570-5).

About 80 percent of the total cost of the new budget is allocated to family consumption items—food, housing, transportation, clothing, personal care, and other items used in family living. The total also includes allowances for gifts and contributions, basic life insurance, income and social security taxes, and occupational expenses.

The relationship between professional salaries and specified characteristics for $1966\frac{4}{}$ is shown below. The percentage deviations from the geometric mean are the influence of that characteristic with all other characteristics held constant. Thus, the -15.0 percent for female indicates that women

are discriminated against in salaries paid when all other factors such as age, experience, and degrees held are taken into account. The bulk of the registrants are part of the professional and kindred employment in the labor force, the same classification which includes elementary- and secondary-school teachers. Although data were not collected for elementary- and secondary-school teachers as a group but only if they had a degree in one of the subject areas covered, the use of the teacher characteristics in Table 6 and the percentage deviation from mean salaries due to these characteristics yields an average salary for elementary- and secondary-school teachers close to the actual average. Thus, one can conclude that the discrimination in salaries paid women and the lower salary paid for teaching in contrast to other occupations also applies to elementary- and secondary-school teachers, after making a -25.7percent adjustment reported for the payment of salary for nine months instead of a full year of employment.

After making allowance for nine-month employment, the average salary of teachers is -18.4 percent, which is about equally divided between discrimination against women (-9.9 percent) and against teaching (-9.4 percent)--below the average salary due on the basis of characteristics of age, experience, and education.

If these discriminations were removed by paying salaries comparable to professional characteristics of teachers, educational expenditures would need to increase by approximately 13 percent. In other words, if the personnel resources used

by schools were paid the price they could command in the economy in other uses, there would be an added expenditure of 13 percent beyond existing expenditures. This 13 percent is borne by teachers in that they are paid less salary than persons having their professional characteristics in comparable employment.

To examine the importance of this underpayment of teachers, the contribution of teachers to the projected entire cost of education in our economy (through the underpayment of salaries) is compared with the contribution of funds from usual sources of revenue, federal, state, and local governments. The amount of underpayment of teachers means that teachers bear 12 cents of what the school dollar would be with comparable salaries to other professions. The federal government contribution is half that of the teachers, or 6 cents. The state governments contribute 35 cents, and the local governments, 47 cents to make the total governmental contribution of 88 cents. In other words, the taxpayers provide seven-eighths of the total resource cost of education. Teachers through the underpayment of salary contribute the other eighth.

Trends in Negotiation

In both 1967-68 and 1968-69 the NEA Research Division conducted national surveys of written teacher/school-board negotiation in school systems with enrollments of 1,000 or more. The following are some of the most revealing changes between the two years:

	1967-68		1968	-69

Faculty in Higher Education

A sample survey of faculty in 4-year colleges and universities in 1964-65 by the NEA Research Division observed the following characteristics of the faculty and their work:

- 80.7 percent were men and 19.3 percent were women.
- The average age was 43.5 years.
- 54.8 percent had a doctor's degree.
- The faculty taught an average of 99.4 students in 3.4 courses for 12.9 hours per week.

- 65.5 percent of the faculty counseled undergraduate students. The faculty member who counseled undergraduate students was assigned an average of 25.2 students.
- 28.8 percent of the faculty counseled graduate students. The faculty member who counseled graduate students was assigned an average of 10.5 students.
- 47.9 percent of the faculty devoted some time to research.
- The average faculty member had 12.2 years of teaching experience in higher education and has been at the present institution for 9.2 years.

Use of salary schedules in 1967-68 was reported by 51.8 percent of the 4-year colleges and universities and by 79.3

The NEA Research Division reports biennially on the median salaries paid in institutions of higher education. The median salary of full-time instructional personnel in colleges and universities in 1967-68 was \$10,235, up 12.7 percent over the median of \$9,081 in 1965-66. Table 12 shows the 10-year trend in median salaries paid by type of institution.

Weighted average salaries in higher education for the 9-month academic year 1968-69 vary with professorial rank and with the type of institution as follows: 5/

^{5/} From Appendix Table 5 of 1968-69 Salary Survey to be published in the Summer 1969 issue of the <u>AAUP Bulletin</u> by the American Association of University Professors. Data are weighted averages for 981 institutions with academic ranks which submitted data for 1968-69.

EXPENDITURES

At all levels of regular schools, public and private, the expenditures in 1968-69 rose to provide increased educational services for a larger number of pupils and to meet rising costs of services, materials, and capital requirements for the educational program.

Total expenditures, including current expense, capital outlay, and interest for regular schools, are shown below for 1967-68 and 1968-69 by level of education and by type of control: 1/2

Increased expenditures

	1967-68 (in bi	<u>1968-69</u> 11ions)	Percent of <u>increase</u>
Elementary and secondary			
Public	\$31.9	\$34.7	8.8%
Private	4.1	4.4	$\frac{7.3}{8.6\%}$
Total	\$36.0	\$39.1	8.6%
Higher education			
Public	\$11.2	\$12.2	8.9%
Private	<u>7.6</u>	8.2	$\frac{7.9}{8.5\%}$
Total	\$18.8	\$20.4	8.5%
Total, all levels			
Public	\$43.1	\$46.9	8.8%
Private	11.7	<u>12.6</u>	7.7
Total	\$54.8	\$59.5	8.6%

Some programs of expenditures for education and training by individuals, private industry, nonprofit institutions, and governments at all levels are not reflected in the educational accounts of the regular schools. Hence, to a large extent the figures for the regular schools understate the nation's total public and private investment in training and learning activities. The categories of schools, classified as nonregular, other, or special institutions, that are mainly profit-making

^{1/} Figures for public elementary and secondary schools are from: National Education Association, Research Division. Estimates of School Statistics, 1968-69. Research Report 1968-R16. Washington, D. C.: the Association, 1968. p. 34-35.

Data for public and private higher education and private elementary and secondary schools are estimates from: U. S. Department of Health, Education, and Welfare, Office of Education. Digest of Educational Statistics, 1968. Washington, D. C.: Government Printing Office, 1968. p. 17.

institutions spent about \$1 billion in 1967-68.2/ However, the major part of the total nonregular investment supported by public and private funds is unknown. Some public programs, such as the Job Corps and Head Start when operated by community agencies, are not reflected in the education accounts.

Federal Expenditures for Education

Most federal educational expenditures are currently directed toward a particular program or a particular group of pupils. The growing amount and type of federal special aids to education is shown in Table 13. In addition to the federal educational programs shown in the table, public and private nonprofit elementary and secondary schools also receive federal aid in cash and surplus agricultural commodities for the school milk and lunch programs. Under the school milk program the milk consumed fluctuated from 3.0 billion half-pints in fiscal 1965 to 2.9 billion in 1968 and rose again to 3.0 billion (estimated) in 1969, and the federal reimbursement rate varied from 3.28 cents per pint in 1965 to 3.14 cents in 1966, to 3.26 cents in 1967, 3.43 cents in 1968, and an estimated 3.44 cents in 1969. Over the period the number of school lunches served rose from 2.9 billion to 3.4 billion. payments and commodity distribution to the states for the school milk and lunch program in fiscal 1969 are estimated at \$471 million. In 1966, a pilot school breakfast program was authorized. By the end of fiscal 1969, this program will be reaching 200,000 school children in 1,500 schools.3/

Federal money and programs increased

Federal aids for public elementary and secondary schools under the Elementary and Secondary Education Act (PL 89-10) presented special problems of accounting for the amount of the aids and their impact on school expenditures. Federal revenues that were spent for summer programs after the close of the fiscal year 1966-67 were considered federal expenditures for fiscal 1967. In reporting on expenditures from federal programs, states followed a mixed course according to their own accounting regulations, with some states entering the summer-school expenditures from federal funds as a school year

Executive Office of the President, Bureau of the Budget. The Budget of the United States Government: Fiscal Year 1970. Washington, D.C.: Government Printing Office, 1969. p. 131.

a/ Compares with budget authority for 1968 and 1969, as follows:

^{1968:} Total, \$9,136 million (New obligational authority, NOA, \$7,133 million; lending authority, IA, \$2,003 million).

authority, LA, \$2,003 million).
1969: Total, \$7,352 million (NOA, \$6,950 million; LA, \$402 million).

b/ Includes both federal funds and trust funds.

1965-66 item and other states entering the summer-school expenditures as an item in the 1966-67 school year. Reporting of federal funds in different fiscal years by the federal government, the states, and local school districts continue.

Furthermore, the state law regulating budget practice in some states precludes budgeting expenditures from revenues that are not secured. Because the federal appropriations were not available at budget adoption time, reports from state and local school systems for the current year may understate the federal revenues and their impact on expenditures.

Timing of federal appropriations

This difficulty of timing of the federal appropriations is recognized in the 1969 federal budget. The budget proposed that 1969 grants for education of the disadvantaged be appropriated by the spring of 1968 (as part of the 1968 supplemental appropriation bill) and that 1970 appropriations be included in the regular 1969 appropriation bill, making them available some 9 to 10 months before the school year begins. This has been accomplished. However, the uncertainty of local school districts with regard to receiving funds has been changed only slightly as final federal budget figures have not been agreed upon for fiscal 1970, that is, for fiscal year beginning July 1, 1969.

School financial accounting

In addition, many of the new federal programs have not been integrated into the state and local financial accounts. The federal grants finance specific programs, and hence separate funds apart from the general funds of the system are set up for each federal program. When state and local systems report educational expenditures, there is a marked tendency to report expenditures from the general funds of the system, thus omitting the federal programs. In estimating public elementary— and secondary—school expenditures this year, the NEA Research Division made a special effort to include all expenditures from federal programs.

Expenditures in Higher Education

In 1968-69, institutions of higher education spent an estimated \$20.4 billion, of which \$12.2 billion was spent by the public institutions and \$8.2 billion by the private institutions as follows (estimated distribution):

- 49 percent for student education
- 17 percent for organized research
- 16 percent for operations connected with the instructional program, student aid, and auxiliary enterprises
- 18 percent for capital outlay.

Public Elementary and Secondary Education

Estimates of expenditures of public elementary and secondary schools, including current expenditures for all programs operated by public school systems, interest, and capital outlay reached a high of \$34.7 billion in 1968-69, up 8.8 percent from \$31.9 billion in 1967-68.

The increase in expenditures from 1966-67 to 1968-69 averaged \$3.2 billion per year. The average increase for the past two years is almost double the average annual increase of \$1.8 billion between 1958-59 and 1966-67.

Expenditures growing faster than GNP

The 11-year annual growth rate of 8.9 percent for total school expenditures may be compared with a rate of 6.7 percent for gross national product (both in current dollars). Over the past 10 years, school expenditures had been increasing at a rate 35 percent higher than the increase registered for the whole economy. However, last year's gain of 8.8 percent

in school expenditures was only 0.1 percentage point higher than the gain of 8.7 percent in GNP. (Tables 14 and 15)

Current Expenditures

In 1968-69, the total current expenditures for elementary and secondary day schools were \$28.2 billion, an increase of \$2.5 billion, or 9.5 percent, over the previous year. (See Table 16.)

Expenditure items enumerated

Current expenditure for elementary and secondary day schools includes amounts paid for general control, instructional service, operation, maintenance, fixed charges, and other school services at all levels of administration—state, intermediate, and basic local. Current expenditure comprises all governmental contributions to the retirement fund and expenditure for school services, including attendance, health services, transportation, food services, and other. This figure does not include payments for capital outlay and interest

 $[\]underline{a}$ / Second quarter of 1969 estimated by NEA Research Division.

on school debt or, except when otherwise noted, amounts spent for community colleges, adult education, summer school, and community services.

The trend in current expenditures per pupil in average daily attendance is shown in Table 17. This year's national figure of \$681 is up 99.7 percent over 1957-58, and up 7.4 percent over last year's revised estimate of \$634. The highest expenditure per pupil in the top state is more than 2.0 times greater than that in the bottom state. (See Table 18.)

State expenditures and U.S. average

Table 19 shows the state's expenditure per pupil in ADA relative to the U. S. average since 1952. Since 1963-64, 21 states have been stable in their positions relative to the U. S. average, shifting not more than 5 percentage points; 23 states shifted 6-li percentage points; 1 state, Mississippi, and the District of Columbia gained 12 percentage points or more. Massachusetts, Minnesota, Texas, Utah, and Washington registered a drop of 12 or more percentage points.

School district consolidation continues

Continuing progress is being made in school district reorganization. In the five years from 1961-62 to 1966-67, 13,269 school systems were eliminated. 4/ Since 1966-67, 2,375 more school districts have ceased to exist. In 1968-69, there were 21,890.

In 1966-67, for the first time since statistics have been collected on school districts by enrollment size, less than half of the school districts had fewer than 300 pupils. For the school year 1966-67, there were 23,390 school systems of which 11,806, or slightly more than half, operated both elementary and secondary schools. Six percent of the school systems (1,037) in 1968-69 were nonoperating districts. Half of these were in two states—Nebraska and South Dakota.

National Education Association, Research Division. Selected Statistics of Local School Systems, 1964-65. Research Report 1966-R13; 1965-66, Research Report 1967-R15; 1966-67, Research Report 1968-R11; 1967-68, Research Report in process. Estimates for 1968-69 from Adopted Budgets of Local School Systems.

*Indicates school systems reporting additional expenditures from federal funds which may have been used as current expenditures for day schools but have been omitted from the regular expenditure accounts on which these per-pupil costs are based.

N.A. = Not available.

 $[\]underline{\underline{a}}$ / Includes attendance services. $\underline{\underline{b}}$ / Decrease in per-pupil expenditures chiefly reflects increase in average daily membership as compared

The 1,400 largest school systems (those having 6,000 or more pupils) account for nearly three-fifths (58 percent) of all public-school enrollments in the nation, and 5,181 school systems with 1,200 to 6,000 pupils accounted for almost one-third. Thus, only 10 percent of all public-school pupils are in systems with enrollments under 1,200.

Expenditures of Local School Systems

In 1968-69, there were 80 school systems in the United States with 50,000 or more pupils enrolled. The trend in current expenditure per pupil in ADM (average daily membership) for 79 of these large systems is shown in Table 20. For the 55 systems reporting on 1968-69 budgets, the median expenditure per pupil of \$488.54 in 1966-67 increased 14.2 percent to \$558.02 in 1967-68. For 1968-69, the median budgeted amount was \$598.99, an increase of 7.3 percent.

The median expenditure per pupil in ADM for instruction rose from \$361.84 in 1966-67 to \$407.91 in 1967-68 for a gain of 12.7 percent, and the median budgeted expenditure per pupil for 1968-69 rose 7.4 percent to \$438.11.

The per-pupil expenditures for the large school systems do not fully reflect the impact of the new federal programs. This is partly because some budgets were completed before allocations for the federal programs were made by the U. S. Office of Education, and because some systems do not integrate the federally funded programs into the regular accounts of elementary and secondary schools. In addition, some of the federally funded programs are not part of the program of the regular public elementary and secondary day school and hence would not be included in these accounts.

The local expenditures per pupil shown in Table 20 differ from the state expenditures shown in Tables 18 and 19 in two respects: (a) Local figures represent expenditures per pupil in average daily membership. State figures are shown on the basis of expenditures per pupil in average daily attendance. The total membership figure, ADM, is about 6 percent larger than the attendance figure because membership includes all pupils on the class rolls or belonging to the classes and the attendance figure excludes pupils absent. (b) Expenditure figures for local school systems frequently do not include direct expenditures made in behalf of schools or pupils or teachers by other governmental units; for example, direct state appropriation for teacher retirement. Di of textbooks, and pupil health services. Differences among systems in performance of school services by nonschool agencies also affect intersystem comparisons of expenditures.

Current Expenditures for Other Programs

Current expenditures of public school systems for junior colleges, adult education, summer schools, and other community services are estimated at \$1,130 million, up 6.8 percent from last year. This increase reflects the addition of community colleges in some states, increased funds for vocational and adult education, and many new and expanded community services administered by the local school district. A part of the rise in other school programs—the current expenditures for programs other than elementary and secondary day schools—is no doubt due to increased federal funds for adult and vocational education, junior colleges, and Head Start and other poverty programs. Table 21 shows the trend.

Community colleges and community services

Capital Outlay and Interest

Capital outlay was estimated at \$4.3 billion, up 5.4 percent from last year and up 51.8 percent in 11 years (see Table 22). Over a similar period, 1958 to 1968, the composite

*NEA Research Division estimates.

construction cost index of the U. S. Department of Commerce increased 31 percent. Thus, much of the rise in expenditures for capital outlay may be due to rising prices.

The U. S. Office of Education estimated that there were 1,764,509 publicly owned instruction rooms in the fall of 1968. The differences in the numbers of new classrooms and the numbers of classrooms retired from service show a decline in the net addition during 1967-68:

New classrooms

School year	Classrooms added	Classrooms abandoned	Net addition
1960-61	72,214	18,733	53,481
1961-62	72,089	18,134	53,955
1962-63	65,300	17,000	48,300
1963-64	69,300	17,100	52,200
1964-65	65,200	16,400	48,800
1965-66	72,600	17,700	54,900
1966-67	71,000	24,000	47,000
1967-68	75,400	19,400	56,000

The U.S. Office of Education has not continued its very critical inventory of classroom facilities since 1964-65. In 1964-65, overcrowding of classrooms and obsolescence were still major problems in school housing:

- 177,800 classrooms were combustible or were in nonpermanent or in offsite facilities.
- 104,400 were overcrowded according to the varying standards of local appraisal.

Some of the classrooms would fit both categories.

When uniform class size standards were used to estimate number of classrooms needed in 1964-65 to bring class size down to stated levels, the following results were obtained:

Classrooms needed to reduce class size

- 50,800 additional rooms were needed to bring class size to a maximum of 30 elementary— and secondary—school pupils.
- 98,300 additional classrooms were needed to bring class size to a maximum of 27 elementary— and secondary—school pupils.
- 285,900 additional classrooms were needed to bring class size to a maximum of 25 elementary— and secondary-school pupils.

From the 1964 inventory of school facilities and later updatings, the U. S. Office of Education estimated the current backlog of school facilities at 519,300 classrooms for 1967-68 to eliminate the following deficiencies:

98,300 to achieve the median pupil class sizes: 27.4 elementary and 27.5 secondary

40,000 to eliminate makeshift classrooms

187,000 to improve pupil/room ratios to 25 elementary and 20 secondary for general student population

194,000 to replace classrooms with 4 or more defects and to house the pupils of the following types:

^{5/} U. S. 90th Congress, 2nd Session. "Projections of Public School Facilities Needs." Congressional Record 114: S8882: July 18, 1968.

85,500 disadvantaged

99,400 handicapped

21,800 vocational

312,600 general

and by type of community as follows:

161,200 urban

138,800 suburban

219,300 rural

Interest rates on school bonds are high, and at the end of this school year were still rising. According to the <u>Bond</u>
<u>Buyers Index</u> of 20 bonds, average rates as of May 28, 1969,
were 5.60 percent. The highest rate reported on this index is
5.69 percent for May 1, 1933, and the lowest rate is 1.29

percent for February 14, 1946. High and low yields for recent years are as follows: $\frac{6}{}$

<u>Year</u>	<u> High</u>	Low		
1963	3.31% (11/14)	3.01% (3/21)		
1964	3.32 (3/19)	3.12 (12/17)		
1965	3.56 (12/9)	3.04 (1/28)		
1966	4.24 (8/25)	3.51 (1/20)		
1967	4.45 (12/7)	3.40 (1/19)		
1968	4.85 (12/26)	4.07 (8/8)		
1969 (May 28) .	5.60 (5/28)	4.82 (1/23)		

Interest payments

Interest payments on school bonds (Table 23) reflect the growing volume of debt outstanding as well as the rising cost of borrowing. Interest payments for 1968-69 are estimated at just over \$1 billion.

^{6/} The Weekly Bond Buyer 176: 67 (Section 1); June 2, 1969.

REVENUE

Public-school revenue from all sources--taxes, grants-in-aid, earning, tuition--is estimated at \$33.7 billion, up 8.5 percent from \$31.1 billion in 1967-68. Since 1957-58, revenue receipts have increased 177.0 percent at an annual rate of 9.7 percent for the 11 years (see Table 24).

There had been very little change in the shares of the three levels of government in school support up to 1965-66. That year the federal share more than doubled, rising from 3.8 percent to 7.9 percent in 1965-66 and remaining at about the same share in 1966-67 and 1967-68, but declining slightly in 1968-69. The state share increased slightly to 40.7 percent, and the local share remained at 52.0 percent (see Table 25).

In the past 11 years all three levels of government have increased their contribution for public elementary and secondary schools. The federal revenues rose an estimated \$2.0 billion; state revenues, \$8.9 billion; and local revenues, \$10.7 billion.

New revenue

In the 11 years the federal government has added 9.1 percent of the total new revenue. However, after a leveling off of federal aid to education the estimated new federal revenue actually declined from the previous year. In the past 11 years new state revenues accounted for 41 percent of the new revenue for schools, and the local sources accounted for 49 percent of the new revenue. Last year new state revenue was 56.6 percent of last year's new revenue, and new local revenue was 44.1 percent of new revenue, and federal revenue declined 0.7 percent.

New revenue in 1968-69 totaled \$2.6 billion. New revenues from federal sources declined \$18.2 million over the previous year, compared with \$309.5 million the year before. New state revenue was \$1.5 billion. New local revenue in 1968-69, at \$1.2 billion, was substantial (see Table 26). Local property tax revenue continues to carry the burden for new school revenue even though new state funds exceeded new local funds in the past year.

Comparison of Central-City and Suburban Tax Burden

Table 27 shows the variation in tax burden as a percent of income for the 22 largest Standard Metropolitan Statistical Areas (SMSA). The additional data in this table indicate the effect that either state or federal financing of poverty-linked

services would have had on central city-suburban disparities in tax burdens in 1962. On the average the tax burden disparities would be cut in half; central-city tax burdens would have been nearly 25 percent lower while suburban tax burdens would have been 15 percent lower.

State Tax Legislation in 1968

General concern about state tax revenue moved from the questions of whether a broad-based tax should be used and whether that tax should be an income or sales tax to the

State-local tax systems

questions of what taxes should be included in the state-local tax system and how the regressive nature of the sales and property taxes could be lessened.

State tax enactments in 1968, an off-year in state legislatures, were substantial, with only one new adoption--a gift tax in South Carolina and rate increases in state sales, income, and selected excise taxes (motor fuel, cigarette, and alcoholic beverages) in 24 states. The enactment of changed tax rates was directed not only at increased revenue but also at changing the burden of taxes among taxpayers and among income groups.

Four states--Florida, Kentucky, Mississippi, and Texas-had rate increases in existing sales and use taxes. In addition to raising its sales and use rate from 3 to 4 percent, Florida extended its tax also to commercial rent, electric power, and intrastate telephone and telegraph charges.

Other major tax legislation dealt with income taxes. Mississippi and New York raised individual income tax rates, while New Mexico eliminated its deduction for federal income taxes. The New York legislation increased tax rates on taxpayers in upper brackets; new rates range up to 14 percent on taxable income over \$23,000 per year. New Jersey increased the rates on its commuters' income tax to correspond with New York's increases in state personal income tax.

Corporate income taxes were raised in six states—Mary-land, Mississippi, New Jersey, New Mexico, New York, and Rhode Island. In Maryland the rates were increased from 5.25 to 70 percent, and a 7.0 percent franchise tax on financial institutions was imposed. New York raised its corporate franchise tax from 5.5 to 7.0 percent, with an increase in the minimum tax from \$25 to \$100.

Nine states enacted rate increases on motor fuel taxes, and 14 states increased excises on tobacco products. Arizona, Florida, and Virginia enacted higher alcoholic beverage tax rates.

Currently all states tax gasoline and alcoholic beverages in some form. North Carolina remains the only state which

c/ Total tax revenue minus the estimated locally financed portion of expenditure for public welfare, health, hospitals, and education of children in families with incomes of less than \$3,000.

does not tax cigarettes. Six states do not tax general sales, 12 do not tax personal income, and 9 do not tax corporate income.

In the November 1968 general election, Nebraska's electorate defeated the proposed constitutional amendment which would have prohibited the state from levying an income tax for state purposes. An individual income tax equal to 10 percent of adjusted federal income tax liability has been effective in Nebraska since January 1, 1968, along with a 2 percent corporate income tax.

In other state elections, the citizens of Massachusetts and Michigan defeated proposed constitutional amendments to allow a graduated income tax. Voters in Ohio defeated a proposed constitutional amendment to permit the exemption of homesteaders over age 65. Utah voters approved two amendments, one to permit the exemption of inventory held for sale in the ordinary course of business and a second to permit the assessment of land for agricultural purposes according to its value for agricultural use. Wyoming voters repealed a \$2 poll tax which had been used for county school purposes.

State Tax Legislation in 1969

THE RESERVE AND THE PARTY OF TH

Most of the 47 state legislatures are meeting in regular sessions this year and will be acting on state tax legislation. To date, two states have levied new sales and use taxes, and six have increased the rates of existing taxes. Five states have increased or extended increases on gasoline tax rates, and two have increased cigarette taxes. In addition, four states have passed legislation affecting alcoholic beverage rates, and two states have increased rates on personal income and two on corporate income. Highlights of the tax measures already passed by the legislatures in 1969 are given in the following paragraphs.

Arkansas increased the alcoholic beverage rate on beer from \$5 to \$7.50 per 32-gallon barrel. This tax increase applies to beer with an alcoholic content of more than 3.2 percent only. The Arkansas legislature also levied an excise tax of 15 percent on the wholesale selling price of cigars, little cigars, and cigarillos.

Georgia increased the state rates on the sale of wine.

Idaho extended its temporary increase (from 6¢ to 7¢) in the gasoline tax rate through 1971; it had been scheduled to expire December 31, 1969.

20.

The legislatures of Indiana, Montana, South Dakota, and Wyoming all passed gasoline tax increases. The Indiana tax rate will increase from 6c to 8c, the Montana tax from 6-1/2c to 7c, the South Dakota tax from 6-1/2c to 7c, and the Wyoming tax from 6c to 7c.

The sales and use tax rates in Maryland have been increased from 3 percent to 4 percent.

Montana increased the tax on personal incomes over \$10,000 as follows: from 8 percent on taxable income of \$10,000 to \$25,000 and 10 percent on taxable income over \$25,000 to 8 percent on taxable income of \$10,000 to \$14,000, 9 percent on taxable income of \$14,000 to \$20,000, 10 percent on taxable income of \$20,000 to \$35,000, and 11 percent on taxable income in excess of \$35,000. In addition, a 10 percent surcharge was levied and a former provision which allowed taxpayers to reduce their final tax liability by 5 percent was repealed. Montana also increased the tax on beer from \$1.50 to \$6 per barrel. In addition, a tax of 12-1/2 percent of the wholesale price of tobacco products was also levied.

North Dakota enacted a comprehensive bill to increase the sales and use tax from 3 percent to 4 percent, to increase the cigarette tax from 8¢ to 12¢, and to impose additional privilege taxes on individuals, estates, trusts, corporations and banks.

New Mexico increased the state sales and use tax from 3 percent to 4 percent as well as the rates of personal income and corporate income. Personal income tax rates for single persons or married persons filing separate returns were raised from 1 percent on net income not over \$500 to 9 percent on income over \$100,000. The tax on incomes of married persons and heads of households ranges from 1 percent on net income not in excess of \$1,000 to 9 percent on net income over \$200,000.

New York raised its state sales and use tax rate from 2 percent to 3 percent.

Oregon enacted a three-part comprehensive tax package which included (a) the enactment of a 3 percent general sales and use tax beginning July 1, 1969; (b) an increase in the corporation excise (income) and corporation income taxes from 6 percent to 7 percent and the tax on banks and financial institutions from 8 percent to 9 percent; and (c) homestead property tax relief in the form of credit against personal income tax. These measures are subject to voter approval in November.

South Dakota enacted several tax measures. The sales and use tax was increased from 3 percent to 4 percent; alcoholic

beverage sales will also be subject to the gross receipts sales tax. The cigarette tax was increased from 8c to 12c, and, as previously noted, the gasoline tax, from 6c to 7c.

Utah raised its sales and use tax rate from 3 percent to 4 percent.

In a comprehensive tax program, Vermont imposed a new 3 percent sales and use tax, effective June 1, 1969. In addition, the tax on corporate income and the franchise tax on banking corporations and loan associations was increased from 5 percent to 6 percent. A 15 percent surcharge was levied on individual incomes to begin after December 31, 1968. The tax on cigarettes was increased from 10¢ to 12¢ a package and the tax on alcoholic beverages was increased from 20¢ to 25¢ a gallon for malt and wine beverages, from \$1.20 to \$1.40 a gallon for fortified wines, and from \$5.10 to \$5.60 a gallon for spirituous liquor.

Only five of the 35 income tax states do not have a state sales tax: Alaska, Delaware, Montana, Oregon, and Vermont. Oregon permits local governments to levy a sales tax. Fourteen of the 44 sales tax states do not have a broad-based state personal income tax: Connecticut, Florida, Illinois, Maine, Nevada, New Jersey, Ohio, Pennsylvania, Rhode Island, South Dakota, Tennessee, Texas, Washington, and Wyoming. New Jersey has a personal income tax on commuters. Tennessee and New Hampshire have an income tax on dividends and interest. Of the 50 states, only New Hampshire has neither a broad-based personal income nor a general sales tax.

Tables 28 and 29 show relative utilization of personal income taxes, general sales taxes, and property taxes by states. The dollar amounts in Table 28 indicate the revenue potential in each state if it collected the average percentage of personal income raised by the 10 highest states in percentage of personal income for that tax in 1967. The percents in Table 29 indicate the degree to which the revenue raised approaches the potential revenue. One hundred percent indicates full utilization of potential. A percentage above 100 indicates greater than average utilization. This table does not reflect either partially or fully the recent legislative enactments of 1967 and 1968.

Program extensions and tax increases

States with unresponsive tax systems can finance program extensions only from tax increases. The expansion of tax yields from existing tax systems in these states generally will not prove adequate to meet increasing expenditure responsibility. Other states will also find themselves in the position of undertaking enactments of new taxes or major

a/ Includes local property taxes.

increases in rates of existing taxes. Those states in which the voter-consumer elects to move public services to a new level, to raise standards of government programs, will need to add to their revenue sources, although the automatic expansion of collections may be adequate for normal increments in public services.

Public service requirements increase because (a) the population to be served increases, (b) price changes for goods and services purchased by governments increase more

b/ U.S. totals are figured independently and may not equal the sum of the columns.

a/ Includes local property tax.

 \overline{b} / Recent major state tax action may affect the individual tax rate and the combined rate. Minnesota, for example, has enacted a sales tax since the 1967 collections were made.

> rapidly than private price changes, and (c) citizens desire a better quality or a broader scope for governmental services. The underlying population data for public elementary and secondary schools indicate a continual increase in the numbers of school-age children to be served by schools.

It has been estimated that governmental prices have increased at the rate of 1.7 percent per year faster than private prices from 1958 to 1964-65. Similar increases are expected for the period ahead. Most important in these relative increases in government prices is the need for salary increases

ERIC

to maintain the same quality level of governmental employees. Unless government salary payments increase with the increase in productivity in the private economy, which is partially passed on as wage increases, governments will gradually have a lower quality of public employee.

Quality and scope of service changes have also occurred in schools with the addition of such programs as kindergarten and junior colleges, and the upgrading of the requirements for teaching certificates.

State School Legislation, 1968

In 1968, the legislatures of 24 states met in regular scheduled sessions, 21 in annual assembly and 3 in biennial sessions. In addition, special sessions were called in 12 states. Many of these legislatures dealt with the problems of financing education in their respective states. Among the significant measures passed in the states were these:

Colorado approved the appointment of a special committee by the governor to study the needs of education, with a mandate to present a plan during the 1969 session. This appointment came about because of the pressure for additional state funds.

Florida provided \$427 million in new state and county support for the biennium to be used for increased salaries, reduced teacher-pupil ratios, educational improvement, and increased retirement benefits.

The Hawaii legislature directed the State Department of Education to use funds carried over from the 1967-68 fiscal year for implementation of a preparatory period for teachers.

Louisiana appropriated sufficient funds so that each school board can operate a 180-day school session for 1968-69 and can provide a program designed to meet the educational needs of the children.

Michigan appropriated \$60 million in new money for revision of the school aid formula with a section providing \$6.3 million for ghetto education problems on a pilot project basis.

Personal income data from the U.S. Department of Commerce, Office of Business Economics. State and local revenue receipts are from the U.S. Office of Education for 1965-66 and prior years and from NEA Research Division for 1967-68 and 1968-69. Personal income is on a calendar-year basis, and school revenue is on the basis of the school year beginning in the calendar year.

NOTE: When the figures for two or more states are identical, the states are given the same rank and the appropriate number is then picked up with the next state in rank.

a/ Preliminary.

Mississippi passed a bill to increase teachers' salaries by \$1,000.

Missouri revised its school foundation program to increase state distribution by \$10 million in addition to \$3 million for natural growth. The state also increased state funds for vocational education by \$2 million for the 1968-69 school year.

New York appropriated \$300 million additional state support for 1968-69, \$26 million to be used for the special educational needs of the poor in 26 urban districts.

Oklahoma enacted a \$16.4 million increase in state funds for its foundation program. This income was partially specified for teachers' salaries to provide a \$1,300 increase over a three-year period and a minimum salary of \$5,000.

Pennsylvania appropriated an additional \$44.7 million for distribution to school districts to assist in meeting the cost of the new state-wide mandated minimum salary schedule.

Minimum salaries for teachers raised

ERIC

The District of Columbia, Mississippi, Oklahoma, and Pennsylvania raised the state minimum salary requirements for teachers.

Effort To Support Public Elementary and Secondary Schools

Since 1957-58, the effort to support schools (as measured by the increase in state and local revenues as a percent of state personal income) has increased from an average of 3.4 percent to 4.6 percent in 1968-69. Table 30 is a general indication of the impact of revenue for schools on state personal income.

Local Tax and Bond Referendums

Table 31 shows the results of voter tax and bond referendums in large school systems for four recent school years.

In large systems enrolling 25,000 or more pupils the experience with bond referendums and tax elections has been as follows:

In 1963-64, out of 30 bond referendums, 3 were rejected and 27 passed. Out of 20 tax elections, 7 were rejected and 13 passed.

National Education Association, Research Division. Selected Statistics of Local School Systems, 1963-64, 1964-65, 1965-66, and 1966-67. Research Reports 1966-R9, 1966-R13, 1967-R15, and 1968-R11. Washington, D.C.: the Association, 1966, 1967, and 1968. And an unpublished Research Report in process for 1967-68.

- In 1964-65, out of 33 bond elections, 2 were rejected and 31 passed. Out of 28 tax elections, 5 were rejected and 23 passed.
- In 1965-66, out of 35 bond elections, 6 were rejected (4 in California) and 29 passed. Out of 30 tax elections, 10 (4 in California) were rejected and 20 passed.
- In 1966-67, out of 35 bond elections, 6 were rejected and 29 passed. Out of 19 tax elections, 6 were rejected and 13 passed.
- In 1967-68 out of 27 bond elections, 8 were rejected and 19 passed. Out of 20 tax elections, 4 were rejected and 16 passed.

Bond issue defeats up from previous year

During the calendar year 1968, voters approved bond issues in support of elementary and secondary schools valued at nearly \$2.3 billion and defeated \$1.5 billion. For the cases reported, 60.0 percent of the amount and 64.2 percent of the number of issues offered were approved. In the previous year, calendar year 1967, voters approved over \$1.9 billion and defeated \$1.1 billion; 63.4 percent of the amount and 67.3 percent of the number of issues offered were approved in 1967.
